Dimensional Analysis

Think of units algebraically! (i.e. you can cancel similar terms!)

$$\text{For example: } \frac{m}{s} \times s \rightarrow \frac{m}{\cancel{s}} \times \frac{\cancel{s}}{1} = m!$$

Using this, we can change units for anything. Watch!

$$30 \text{ ft} \times \frac{12 \text{ in}}{1 \text{ ft}} \rightarrow 30 \cancel{\text{ ft}} \times \frac{12 \text{ in}}{1 \cancel{\text{ ft}}} = 30 \times 12 \text{ in} = 360 \text{ in}$$

What about units like m^2 or cm^3 ? No problem!

Suppose we need to convert 10 m^2 into mm^2 .

Just remember you need to square $\frac{1000 \text{ mm}}{1 \text{ m}}$ to make the m^2 cancel.

$$10 \text{ m}^2 \left(\frac{1000 \text{ mm}}{1 \text{ m}} \right)^2 \rightarrow 10 \text{ m}^2 \left(\frac{1000 \text{ mm}}{1 \text{ m}} \right)^2 = 10,000,000 \text{ mm}^2$$

Notice if you do it wrongly like this: $10 \text{ m}^2 \left(\frac{1000 \text{ mm}}{1 \text{ m}} \right)^2 = 10,000,000 \text{ mm}^2$, which is off by 9,990,000! Oh no!

All the numbers in the parentheses have to get squared for this to work!

Now let's do a more complicated one. We need to convert 360 km/h to m/s .

$$360 \frac{\text{km}}{\text{h}} \left(\frac{1000 \text{ m}}{1 \text{ km}} \right) \left(\frac{1 \text{ h}}{60 \text{ min}} \right) \left(\frac{1 \text{ min}}{60 \text{ sec}} \right)$$

We cancel the km, h, min terms, leaving only m and s.

$$360 \frac{\cancel{\text{km}}}{\cancel{\text{h}}} \left(\frac{1000 \cancel{\text{m}}}{1 \cancel{\text{km}}} \right) \left(\frac{1 \cancel{\text{h}}}{60 \cancel{\text{min}}} \right) \left(\frac{1 \cancel{\text{min}}}{60 \text{ s}} \right) = \frac{360 \times 1000}{60 \times 60} = 100 \frac{\text{m}}{\text{s}}$$

You can use dimensional analysis to check calculations. For example, consider the easy formula distance = rate x time. $[\text{m}] = [\text{m/s}][\text{s}]$. Notice the seconds cancel and the two sides are equivalent!

Using terms with units can help catch mistakes before they happen. For example you need a distance in m and are given a time in seconds and a velocity in mi/h . $[\text{m}] \neq [\text{mi/h}][\text{s}]$. No units cancel. We have to convert using the above methods.
